SUMMARY

Web developer and computing student who builds, documents and ships full-stack projects independently. Used to remote, self-directed work: I gather requirements from real clients, write the specifications and UX documentation myself, break problems into verifiable steps, and check the results before delivering. Comfortable moving between implementation, written analysis and quality review across unfamiliar domains — public-sector web portals, construction, and public-health data systems.

CORE SKILLS

Development	JavaScript (ES modules), React, Next.js, Python, Django, Flask, HTML/CSS, REST API integration, OAuth2, Git & GitHub, Vite, Playwright automation
Analysis & Writing	Technical documentation, requirements gathering, UML modeling, information architecture, usability testing, structured QA and review
Collaboration	Remote async work, Kanban and sprint planning, written client communication and proposals
Languages	Portuguese (native) · English (intermediate, B1 — daily reading of technical documentation, regular written use)

EXPERIENCE

Freelance Web Developer — Self-employed

2025 – Present

Remote · Natal, RN, Brazil

- Deliver websites end to end for local businesses — first client conversation, requirements, build, handover — owning scope, deadlines and quality review without supervision.
- Ongoing client **Cunha Lima Construtora** (construction): built and maintain the company site in React/Next.js, restructuring the call-to-action hierarchy and navigation behaviour to improve lead capture.
- Run my own outbound pipeline: prospect research, lead qualification, written outreach and a tiered proposal model — every stage documented and repeatable.

Process Automation — Independent Project

2026

Hórus / e-SUS AF (Brazilian public health systems)

- Built a Python + Playwright script automating repetitive medication-dispensation data entry from CSV records, with authenticated session handling and a per-record manual confirmation step — accuracy over throughput.
- Analysed the successor system's API-first architecture and documented the migration implications.

SELECTED PROJECTS

BE-Desk — Capstone Project (TCC)

In progress

- Django + React system for scheduling, space reservations and inventory in an institutional sports department, with SUAP OAuth2 single sign-on, an admin dashboard and a blog module.
- Responsible for UML modeling, UX wireframes, interface implementation and GitHub project management (Kanban, sprints) in a three-person team.

Projeto ARI — Municipal Portal Redesign

[live prototype](#)

- Audited the official São Tomé/RN city portal, catalogued its usability failures, and produced an information-architecture document, diagrams and a high-fidelity redesign prototype.
- Wrote a comparative usability-test protocol to measure the prototype against the original site with real users.

API-Consuming Web Applications

github.com/devigMurilo

- Multi-module Vite/JavaScript apps consuming public REST APIs, with strict separation between the data and DOM layers, concurrent requests, and systematic debugging of CORS, scoping and request-construction errors.

EDUCATION

Federal Institute of Rio Grande do Norte (IFRN) — Campus São Paulo do Potengi

In progress

Technical Degree in Internet Computing (Técnico em Informática para Internet)

- Coursework in web development, databases, software analysis and design, and UX/UI principles; capstone project (BE-Desk) currently under development.
